AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

Claims 1-19 (canceled).

Claim 20 (currently amended): A method for forming a thick film pattern, comprising the steps of:

applying to a support a photosensitive paste including ~~an inorganic~~ a conductive powder, a photosensitive monomer, a photopolymerization initiator, and a polymer, wherein a ratio of the photosensitive monomer to a total amount of the photosensitive monomer and the polymer satisfies the condition represented by the following Formula:

$$\text{photosensitive monomer}/(\text{photosensitive monomer} + \text{polymer}) \geq 0.86,$$

so as to form a photosensitive paste film;

subjecting the photosensitive paste film to an exposure treatment; and

developing the photosensitive paste film subjected to the exposure treatment so as to form a thick film pattern; wherein

the contents of the ~~inorganic-conductive~~ powder, the photosensitive monomer, and the photopolymerization initiator constituting the photosensitive paste are within the following ranges:

~~inorganic-conductive~~ powder: about 60 to about 90 percent by weight of the photosensitive paste;

photosensitive monomer: about 5 to about 39 percent by weight of the photosensitive paste; and

photopolymerization initiator: about 1 to about 10 percent by weight of the photosensitive paste; ~~and~~

~~the inorganic powder includes a metal powder.~~

Claim 21 (canceled).

Claim 22 (previously presented): The method for forming a thick film pattern according to Claim 20, wherein the photosensitive paste includes a photosensitive monomer having a double bond concentration within the range of about 8 mmol/g to about 11 mmol/g.

Claim 23 (previously presented): The method for forming a thick film pattern according to Claim 20, wherein the photosensitive paste includes a photosensitive monomer having an ethylene oxide structure with a degree of polymerization of about 3 or less.

Claim 24 (previously presented): The method for forming a thick film pattern according to Claim 20, wherein the photosensitive paste comprises an ultraviolet absorber.

Claim 25 (previously presented): The method for forming a thick film pattern according to Claim 20, wherein the photosensitive paste comprises a solvent in a proportion of about 5 percent by weight or less.

Claim 26 (previously presented): The method for forming a thick film pattern according to Claim 20, wherein development is conducted by using an organic solvent in the development step.

Claim 27 (previously presented): The method for forming a thick film pattern according to Claim 20, wherein the exposure treatment is conducted while the

photosensitive paste film and a photomask are arranged to be kept from contacting with each other in the exposure step.

Claim 28 (previously presented): The method for forming a thick film pattern according to Claim 20, wherein the photosensitive paste is subjected to the exposure treatment without using a photomask in the exposure step.

Claim 29 (previously presented): A method for manufacturing an electronic component, comprising the steps of:

forming a thick film pattern by the method according to Claim 20; and
firing the resulting thick film pattern.

Claim 30 (canceled).

Claim 31 (currently amended): A photolithography photosensitive paste comprising:

~~an inorganic~~ a conductive powder;

a photosensitive monomer;

a photopolymerization initiator; and

a polymer; wherein

a ratio of the photosensitive monomer to a total amount of the photosensitive monomer and the polymer satisfies the condition represented by the following Formula:

$$\text{photosensitive monomer} / (\text{photosensitive monomer} + \text{polymer}) \geq 0.86;$$

the contents of the ~~inorganic~~ conductive powder, the photosensitive monomer, and the photopolymerization initiator are within the following ranges:

~~inorganic~~ conductive powder: about 60 to about 90 percent by weight of the photosensitive paste,

photosensitive monomer: about 5 to about 39 percent by weight of the

photosensitive paste, and

photopolymerization initiator: about 1 to about 10 percent by weight of the photosensitive paste; and

~~the inorganic powder includes a metal powder.~~

Claim 32 (canceled).

Claim 33 (previously presented): The photolithography photosensitive paste according to Claim 31, wherein the photosensitive monomer is a photosensitive monomer having a double bond concentration within the range of about 8 mmol/g to about 11 mmol/g.

Claim 34 (previously presented): The photolithography photosensitive paste according to Claim 31, wherein the photosensitive monomer is a photosensitive monomer having an ethylene oxide structure with a degree of polymerization of about 3 or less.

Claim 35 (previously presented): The photolithography photosensitive paste according to Claim 31, further comprising an ultraviolet absorber.

Claim 36 (previously presented): The photolithography photosensitive paste according to Claim 31, further comprising a solvent in a proportion of about 5 percent by weight or less.
